

Dedi: Troubleshooting Guide

Quick Solutions to Common Problems

Server Won't Start

All Checkmarks Not Green

Problem: Install button doesn't make all status items green  **Solutions:**

1. Click **Install** again and wait longer (can take 10-30 minutes)
2. Check internet connection
3. Run Dedi as Administrator
4. Temporarily disable antivirus during installation

Authentication Token Error

Problem: "Authentication token errors" in status panel **Solutions:**

1. Get new token from Steam website (click **Get Token**)
2. Copy token carefully (no extra spaces)
3. Paste in **Config** → **Server** → **Steam Token**
4. Click **Generate** button
5. Restart server

Start Button Doesn't Work

Problem: Clicking Start does nothing **Solutions:**

1. Verify all checkmarks are green 
2. Click **Generate** to create server properties file
3. Check Status panel for error messages
4. Try **Reset** button in Config tab

Players Can't Connect

Server Not Visible

Problem: Server doesn't appear in Aska multiplayer browser **Solutions:**

1. Check **Region** setting matches player locations
2. Ensure server is actually running (green checkmarks)

3. Wait 2-3 minutes for server to appear in browser
4. Remove password for public access

Connection Refused

Problem: Server visible but players can't join **Solutions:**

1. Check Windows Firewall - allow Dedi and AskaServer
2. Try different ports in **Config** → **Server**:
 - Steam Game Port: 27017
 - Steam Query Port: 27018
3. Restart server after port changes

Password Issues

Problem: Players prompted for password on public server **Solutions:**

1. **Config** → **Server** → **Password** - leave completely empty
 2. Click **Generate** button
 3. Restart server
-

Server Crashes

High Crash Restart Count

Problem: "Crash Restarts" number keeps increasing **Solutions:**

1. Check **Saveld** is correct - click **Saveld** button to browse
2. Verify save files aren't corrupted
3. Click **Install** to update to latest server version
4. Change **Autosave Style** to "every morning"

Server Starts Then Stops

Problem: Server connects then immediately disconnects **Solutions:**

1. Check Status panel for specific error messages
 2. Verify **server properties.txt** file exists
 3. Try with empty world (no Saveld)
 4. Check available disk space (need 5GB+)
-

Configuration Issues

Settings Won't Save

Problem: Changes don't stick after restart **Solutions:**

1. Click **Generate** after making changes
2. Check Dedi has write permissions to its folder
3. Run as Administrator if needed
4. Verify config files aren't read-only

Can't Find Save Files

Problem: Saveld button can't locate Aska saves **Solutions:**

1. Default location: `%APPDATA%/../LocalLow/Sand Sailor Studio/Aska/data/server/`
2. Look for folders named `savegame_[numbers]`
3. Create new world in Aska first, then configure Dedi
4. Use empty Saveld for new world

World Settings Don't Work

Problem: World tab settings have no effect **Solutions:**

1. **Options** → **Enable Worldgen** must be checked
 2. **Config** → **Server** → **Mode** must be "custom"
 3. Must **Load** settings first, then modify, then **Save**
 4. Restart server after saving world changes
-

Installation Problems

Download Fails

Problem: Install process stops or fails partway **Solutions:**

1. Check internet connection stability
2. Disable antivirus temporarily
3. Run Dedi as Administrator
4. Clear Windows temp files
5. Try again during off-peak hours

Insufficient Disk Space

Problem: "Not enough space" errors **Solutions:**

1. Need minimum 5GB free space

2. Clear old backup saves from `saves/` folder
3. Move Dedi to drive with more space
4. Use Disk Cleanup to free system space

Firewall Blocking

Problem: Windows blocks Dedi or downloads **Solutions:**

1. Windows Firewall → Allow an app
 2. Add both `Dedi_x64.exe` and `AskaServer.exe`
 3. Enable for both Private and Public networks
 4. Restart Dedi after firewall changes
-

Performance Issues

Slow Server Response

Problem: Players experience lag or delays **Solutions:**

1. Reduce **Autosave Style** frequency
2. Lower backup save limits in Config
3. Close other programs using CPU/memory
4. Check network connection quality

High Memory Usage

Problem: Server uses too much RAM **Solutions:**

1. Restart server daily for large worlds
 2. Reduce backup save counts
 3. Use "every morning" autosave style
 4. Monitor Windows Task Manager
-

Emergency Recovery

Complete Reset

Problem: Nothing works, need to start over **Solutions:**

1. **Config** → **Reset** button
2. **Options** → **Reset** button
3. Delete `config.ini` and `options.ini` files

4. Restart Dedi (creates new default files)

Backup Recovery

Problem: Need to restore previous working state **Solutions:**

1. **Config** → **Load** - restore saved configuration
2. Copy backup files from `backup/` folder
3. Restore save files from `saves/` folder
4. Restart Dedi after restoration

Contact Support

Problem: Still having issues **Resources:**

1. Check Status panel for exact error messages
 2. GitHub Issues: <https://github.com/at67/Dedi/issues>
 3. Include Dedi version and Windows version
 4. Describe exact steps that cause the problem
-

Prevention Tips

Regular Maintenance

- Save your working configuration: **Config** → **Save**
- Keep backup of important save files
- Restart server weekly for stability
- Monitor disk space regularly

Before Making Changes

- Test one setting at a time
- Note what worked before changing
- Use **Reset** if you get lost
- Save working configs with descriptive names

Monitoring

- Watch Status panel for warnings
- Keep "Crash Restarts" at 0
- Verify all green checkmarks daily
- Check player connections work properly
